Embryonic Stem Cells | HowStuffWorks
When an embryo contains about eight cells, the stem cells are totipotent - they can develop into all cell types. At three to five days, the embryo develops into a ball of cells called a blastocyst . A blastocyst contains about 100 cells total and the stem cells are inside.

Arguments for and Against Embryonic Stem Cell Research
In 3 to 5 days, the embryonic stem cells are removed. The blastocyst is destroyed. Stem cells can be used to generate an organ or tissue that is a genetic match to the skin cell donor. The first 6 steps are same for reproductive cloning. However, instead of removing stem cells, the blastocyst is implanted in a woman and allowed to gestate to birth.
